

DANCER-Study

Sponsor: German Center for Neurodegenerative Disease (DZNE)

The DANCER study represents the control group for the DESCRIBE-FTD study. To decide whether clinical characteristics and their change over time are indicative of pathological processes, we require data of healthy individuals for comparison. Just like the DESCRIBE-FTD study, analyses of clinical data, MRI data, as well as the results of biomaterial, including genetic analyses, are planned.

The data are collected during annual assessments. Part of the annual visit are neuropsychological assessments, blood tests, and, if applicable, a lumbar puncture. Additionally, a MRI assessment is planned.

Requirements for participation:

Partake can anyone above the age of 50 years without memory problems and evidence of neurodegenerative or cerebrovascular disease.
